

Introduction to Prostate Cancer

An important area of our work is the prostate.

Our physicians, technology and experience dates back more than a decade with 2,000 men treated. We have five and ten-year comparison data to most every major center in America. For those with prostate cancer our data should be compelling to evaluate regardless of treatment decisions.

Many chose treatment with Radiosurgery New York physicians because of our experience as well as our data. Many men wish to avoid the surgery associated with radical prostatectomy or the prolonged course of radiation associated with external radiation or conformal radiation.

By using our unique program of seeds plus fractionated stereotactic radiosurgery, we have high control rates and high cancer-free survival at five and ten years. Also, the quality of life appears to be better than that associated with open surgery. This data is true both for those with low risk-low PSA-low Gleason score cancers, as well as those with high risk cancers.

We have a booklet and video exclusively produced for those with prostate cancer and we would encourage you to review this material before making any treatment decisions.

You can contact us directly at 212-CHOICES or e-mail questions to GIL.LEDERMAN@RSNY.ORG. Our monthly seminars are option to the public at no charge.
